Preparing the Data

Autism fMRI images using ABID Dataset

ABIDE is a collaboration of 16 international imaging sites that have aggregated and are openly sharing neuroimaging data from **539 individuals** suffering from ASD and **573 typical controls**.

Autism Brain Imaging
Data Exchange

PREPROCESSED

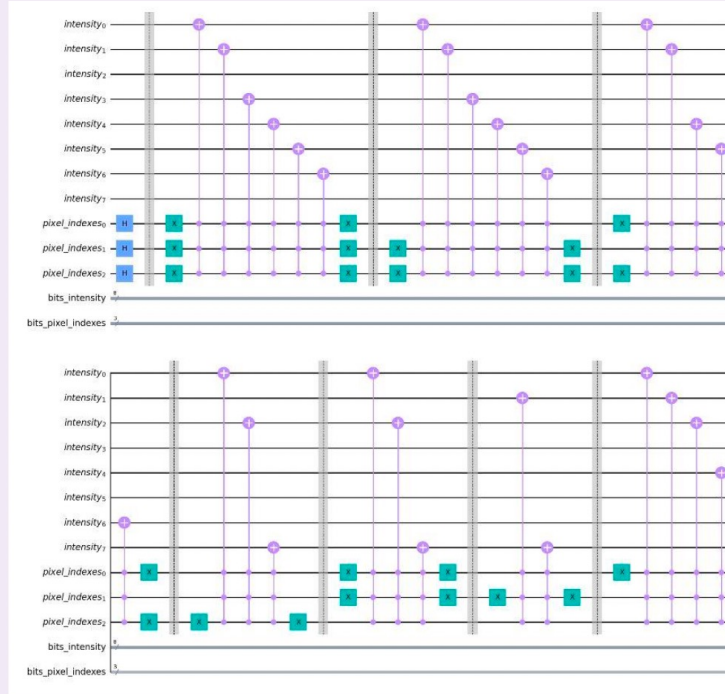

Quantum Image Representation : NEQR 、FRQI and QPIE

or

2D or 3D images

FRQI & NEQR

The goal of the Flexible Representation of Quantum Images (FRQI) allows an **efficient encoding of the classical data into a quantum state and the subsequent use of operators for image processing operations**

The **Novel Enhanced Quantum Representation** NEQR was created to improve over FRQI by leveraging the basis state of a qubit sequence to store the image's grayscale value

QPIE

The QPIE representation uses the probability amplitudes of a quantum state to store the pixel values of a classical image.

Challenge

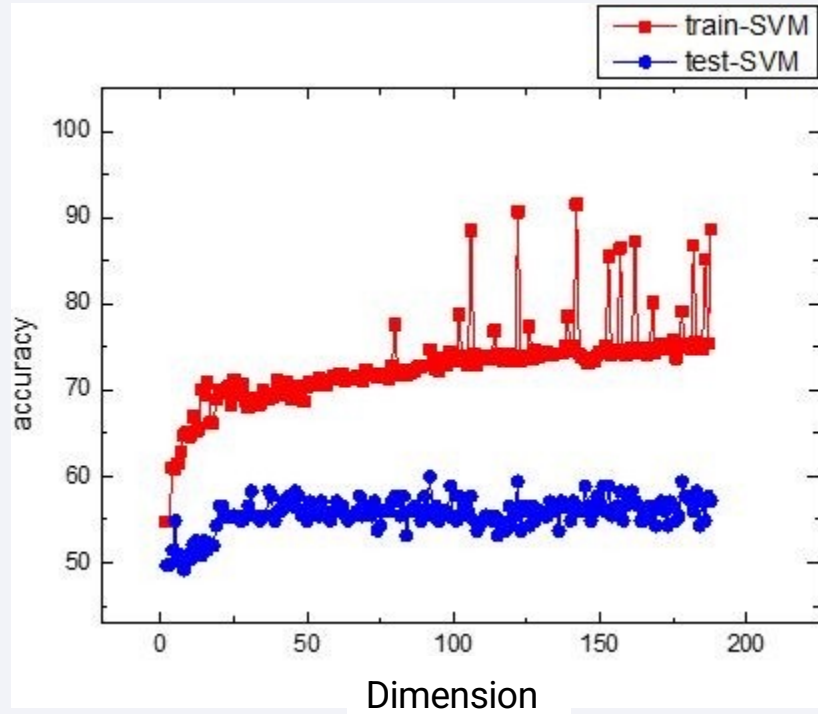

Method 1 : SVM and QSVM

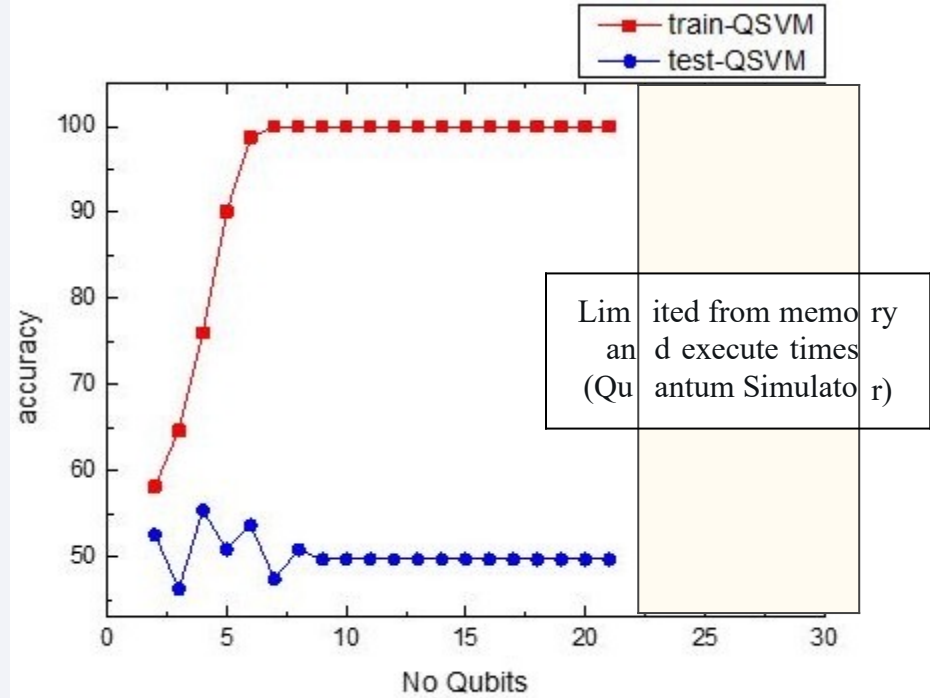

Two data (one pair)

SVM

QSVM

Method 2 : 3DCNN and 3DQCNN

3DCNN

3DQCNN

Conclusion and future work

- QSVM have an huge advantage on features' learning process compared to classical SVM. The training dataset reached 90% accuracy with stable performance. (SVM only reached 75% and unstable.) However, there is a image pre-processing issue need to be done in our future work.
- 3DQNN can speed up the learning process (less iteration) than classical 3DCNN in our current stage. However, there is a over-fitting need to be solved in our futurework. (training dataset reached 90%, test dataset only reached 50%)
- Two promising QML framework have already developed. The next step will collaborate with experts in the field of fMRI to deal with issue in data pre-processing.
- When everything is well-settled, we can run those on a real QC

Thank you for your attention!!!
